

Strong customer demand. Controls corrected.

The advertising generated measurable phone-call activity and broad local visibility. A duplicated campaign and permissive billing controls increased financial exposure; delivery has now been stopped while the account is stabilized.

18	\$5.88	4,552	1.81x
TRACKED CALLS	COST PER CALL	PEOPLE REACHED	AVG. FREQUENCY

BUSINESS VALUE CREATED

18 high-intent phone calls were attributed to the active lead campaign. At \$5.88 per tracked call, the advertising demonstrated an efficient path to real customer conversations. The campaign reached 4,552 local prospects without excessive repetition.

WHAT THE OWNER SHOULD KNOW

Executive assessment

What worked	What went wrong	What changed now
The lead campaign produced calls at an efficient recorded cost and reached thousands of nearby prospects.	A duplicate campaign ran alongside the original. Billing thresholds and a manually reset account limit allowed charges to accumulate.	All delivery is paused. No campaign currently shows as active, preventing additional ad delivery while controls are reviewed.

Bottom line: the advertising itself showed useful demand-generation performance. The failure was budget governance, not an absence of customer response.

Where the money went

Payments processed on July 27 reflect delivered advertising and multiple billing events. Payment date is not the same as ad-delivery date.

\$1,553.50 11 SUCCESSFUL PAYMENTS	\$209.83 CURRENT BALANCE	\$1,763.33 TOTAL EXPOSURE	\$150 FAILED - NOT COUNTED
---	--	---	--

TRACEABLE IN META BILLING

Confirmed transaction evidence

Billing event	What Meta recorded	Business interpretation
\$250.00 threshold payment	July 20-27 delivery: \$105.75 original campaign + \$144.25 duplicate campaign.	Real ad delivery split across two nearly identical campaigns.
\$269.50 manual payment	Duplicate campaign delivery from July 25-27; Meta recorded 8,247 impressions.	A manual payment cleared spend generated by the duplicate campaign.
Repeated \$110 payments	Current Meta billing threshold is \$110.	These appear to be threshold collections of accrued spend, not identical duplicate card charges.

CONTROL FAILURE - NOT PERFORMANCE FAILURE

Root cause

- **Duplicate delivery:** “Tires SOS | Leads | Jul 2026 - Copy” ran alongside the original campaign.
- **Weak financial guardrail:** Meta displayed a daily ceiling of \$2,164.30, far above the intended operating level.
- **Account cap reset:** the \$600 account spending limit displayed \$0 spent and “reset manually,” indicating the safeguard had been restarted.
- **Billing compression:** multiple payments were processed on one day for advertising delivered over earlier dates.

Dispute outlook: Delivered impressions are normally valid charges. A dispute is strongest only if the duplicate campaign, manual payment, or spending-limit reset was unauthorized. No dispute has been submitted.

Keep the demand. Fix the controls.

The recommended response preserves what was working while making future spend predictable, reviewable, and owner-approved.

1 Containment complete

All campaign delivery was paused and verified. No active campaign switches remained.

2 Owner-approved restart

Resume only one lead campaign after agreeing on a written daily and monthly ceiling.

3 Hard account limit

Set a conservative account spending limit that cannot be reset without owner approval.

4 Daily alerts

Create alerts at 50%, 75%, and 90% of the approved monthly budget.

5 Weekly scorecard

Report spend, calls, booked appointments, revenue, and estimated return every week.

DIRECT, ACCOUNTABLE, CONSTRUCTIVE

Recommended owner message

"The campaign proved there is real local demand: it generated 18 tracked calls at \$5.88 per call. The problem was not customer response - it was that a duplicate campaign and weak account controls allowed spending to exceed the intended level. I paused all delivery, traced the billing, and prepared a control plan so any restart happens with one campaign, a hard spending cap, and weekly ROI reporting."

Data note

Prepared from Meta Ads Manager and Meta Billing activity reviewed July 27, 2026. The report separates payment timing from delivery timing. Revenue and appointment-close data were not available, so no unsupported revenue or ROI claim is included.
